DPN

β-Diphosphopyridine Nucleotide
Nicotinamide Adenine Dinucleotide (NAD)

IN BULK

Users of large quantities of DPN are invited to discuss their needs with Sigma. As the oldest manufacturer of the finest DPN and DPNH in the World, we are in an excellent position to cooperate. Multi-Kilo quantities can be shipped immediately from our ample stocks.

PRICES—Can be negotiated for both auto analyzer and research grades in bulk.
PURITY—We offer several grades to suit **your** satisfaction.

GRADE V

This is a careful small-batch repurification of our well known Grade III. Minor impurities are reduced to eliminate the reported "enzyme lag".

Ref. 1. Dalziel, K. J. Biol. chem., **283,** 1538 (1963)
2. Winer, A. D. J. Biol. chem., **239,** PC 3598 (1964)

GRADE III

Our World renowned work-horse grade: probably the most widely accepted DPN in the World, for both Research and Clinical studies. Recommended where near-maximum precision is essential.

GRADE AA

A special grade prepared for applications that do not require highest purity. Altho not equal to our Grade III, this grade is guaranteed to be **at least** as pure as any lower priced DPN presently available for Automatic Analyzer usage. Yet the price in bulk quantities of 100 grams and over is considerably lower than is possible for our Grade III.

If you have a substantial need for DPN (NAD) please phone me "Person-to-Person" (Collect, of course) at any time of the day or night, and from anywhere in the World. I think I can make it worth your while.

Thanks
Dan Broida
My phone—(314)—993-6418

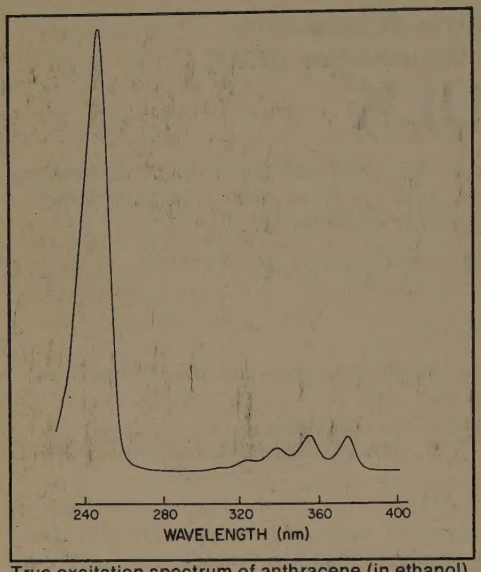
This is the way all fluorescence spectra are going to look.



True excitation spectrum of anthracene (in ethanol). 5 mμ bandpass. Emission wavelength: 420 mμ.

It's the *true* fluorescence spectrum of anthracene, (above) recorded on Perkin-Elmer's new Model MPF-3 Fluorescence Spectrophotometer. It looks the way an excitation fluorescence spectrum was meant to look. Identical to its UV absorption spectrum—*but recorded at a concentration 1000 times lower!*

Up to now fluorescence excitation or emission spectra could not be used routinely between laboratories or for publication because the relative intensities of peaks were incorrect. Incorrect because source and detector *interacted* with spectra.

Now, with our new MPF-3 you can record *true* band intensities permitting day-to-day, instrument-to-instrument, and lab-to-lab comparisons. Comparisons that are both easy and valid.

You can begin to realize the full power of fluorescence spectrophotometry—its ability to measure nanogram levels (for pollutant analysis), to identify components in mixtures, to analyze powders and solids, to probe into living cell structure.

If you want to make quantum efficiency measurements (to study rare earth phosphors, for example) you're way ahead if your emission and excitation spectra are true and don't have to be corrected.

What's more, you can make direct comparison of fluorescence excitation and UV/VIS absorption spectra published in literature and reference libraries.

The new MPF-3, like the MPF-2A which has become the reliability standard for fluorescence spectrophotometers, has continuously adjustable slits and high efficiency grating monochromators. This gives you greater precision in your quantitative analyses and more accurate working curves. And the wide range of accessories increases its versatility.

Write for full information on the newest addition to Perkin-Elmer's Fluorescence Product line and we'll send you our brochure and four technical reprints. If you own an MPF-2A, we can provide an accessory to give it the true spectra capability of the MPF-3. Write to Instrument Division, Perkin-Elmer Corporation, 810 Main Avenue, Norwalk, Conn. 06852.

PERKIN-ELMER
